

MODEL PX-8 Series optional Kits

PX-833 and PX-8 BCK Alternator Cable Support Clamp Kits

What do the support clamp kits do? A large diameter battery cable is heavy and it will bounce up and down when the vehicle goes over a bump. The battery cable terminal end is the weak point and if left unsupported, it can flex up and down and eventually break in two. This could allow a high amperage 28-volt battery cable to bounce around unprotected in the engine compartment, sparking and shorting out against any metal it touches.

PennTex Industries has two different Cable Support Clamp Kits available. The PX-8150 Kit, below on the left, supports only the positive output cable. and attaches to the rear of the alternator using two of the rear cover plate bolts.

The PX-8968 Cable Support Clamp Kit, below on the right, supports the heavy positive & negative alternator cables, and also the two smaller alternator wires that can break off just as easily as the larger cables. With this kit, a replacement rear cover plate is included for the clamp mount.

Eliminating a known trouble spot with these support kits will make your vehicle more reliable.
